$K < 1$ , favors reactants

$K > 1$ , favors products

solids and liquids don't matter

Q = substitute at current concs

$Q < K$ , will make more products

Arrhenius acid – produces  $H^+$  in water, base- produces  $OH^-$  in water

Lowry-Bronsted acid – proton donor, base – proton accepter, amphiprotic – either/or

conjugate acid – what's left when base takes proton

conjugate base – what's left when acid loses proton

$$pH = -\log[H^+]$$

$$\text{autoionization } K_w = [H^+][OH^-] = 1E-14 (25C)$$

$$K_a * K_b = K_w$$

$$pOH = -\log[OH^-]$$

$$pH + pOH = 14$$
